A Theory of Business Transfers

Privately-owned firms

- Account for 1/2 of US business net income
- Dominate discussions on growth, wealth inequality, tax policy
- But pose challenge for
 - theory: technology of capital accumulation and transfer
 - measurement: no reliable data on private wealth

- Theory of private firm dynamics and capital reallocation
- Characterization of competitive equilibrium
- Administrative IRS data to discipline theory (in progress)
 - estimate share of transferable value and investment technology
- Business transfers allow us to
 - back out model-based measure of business valuation
 - study effect of taxing business income, capital gains, wealth on investment, entry, welfare

- Buyers and sellers both report sale
 - seller has to pay capital gains
 - buyer has to report depreciable assets
- Price allocated across asset types
 - seller wants to allocate to long-term
 - buyer wants to allocate to short-term
- \Rightarrow Conflict of interest and thus consistent reporting

What do we know about Private Business Capital?

Form 8594 (Rev. November 2021) Department of the Treasury Internal Revenue Service Name as shown	Go to www.ira.gov/Form8594 for instructions and the latest information.		ONB No. 1545-0274 Attachment Sequence No. 169 on return		
Purchaser	k that identifies you: Seller I Information r party to the transaction		Other party's identifying num	iber	
	ber, street, and room or suite no.) state, and ZIP code	3 Total sales	price (consideration)		
4 Assets	al Statement of Assets Transferred Aggregate fair market value (actual amount for Class	9 8	Allocation of sales pr	ice	
Class I Class II Class II	s s	5 5 5			$\stackrel{\textstyle \swarrow}{\leftarrow} \operatorname{Cash/securities}$
Class IV Class V	\$	s s			$\leftarrow \text{Inventories} \\ \leftarrow \text{Fixed assets} \\$
Class VI and VII	\$ \$ aser and selier provide for an allocation of the sale	\$ \$	sales contract or in another		\leftarrow Sec. 197 intangibles
written docum	vent signed by both parties?	n of asset Clas	ases I, II, III, IV, V, VI, and VII	Yes No	
not to compe arrangement	se of the group of assets (or stock), did the purcha te, or enter into a lease agreement, employment o with the seler (or managers, directors, owners, or er in a statement that specifies (a) the type of agreeme foot locivition interestin aid or to be naid under the	contract, mana mployees of th nt and (b) the	agement contract, or similar e seller)?		

- Transferred assets are primarily intangible (from form $8594 \approx 70\%$)
 - Customer bases and client lists, non-compete covenants
 - Licenses and permits, trademarks, tradenames
 - Workforce in place
 - Goodwill and on-going concern value
- Assets are **sold as a group**
- Sale requires time to find buyers/negotiate (from brokered data \approx 290 days)

 \Rightarrow Add intangible investment and transfers to Hopenhayn-style model

- Firm Dynamics
 - Hopenhayn (1992), Hsieh and Klenow (2009, 2014), Sterk et al. (2021)
- Capital Reallocation
 - Holmes and Schmitz (1990), Ottonello (2014), Guntin and Kochen (2020), Gaillard and Kankanamge (2020), David (2021)
- Entrepreneurship and Private Wealth
 - Cagetti and De Nardi (2006), Saez and Zucman (2016), Smith et al. (2019)
- Capital Gain Taxes and Wealth Taxes
 - Chari et al. (2003), Scheuer and Slemrod (2020), Guvenen et al. (2021), Agersnap and Zidar (2021)

- Infinite horizon, continuous time
- Demographics:
 - total population *N*: workers and business owners
 - newborns enter the economy, choose occupation, exit at rate δ
- Preferences: risk-neutral
- Workers supply labor inelastically

Environment

- Entry technology: entry cost $n_0 w$, draw $s \sim G(s)$, where s = (z, k)
- Productivity, z
 - non-transferable
 - evolves according to $dz = \mu z dt + \sigma z dB$
- Business capital, k
 - built through investment: $dk = \theta \delta_k$, convex cost $C(\theta)$
 - bilaterally traded
- Production technology:

$$y(s,n) = z(s)k(s)^{\alpha}n^{\gamma}$$

where *n* is a rentable input (today: labor)

Markets

Bilateral trade of capital:

- Firms access market at rate η
- Allocation between s and š: k^m(s, š) ∈ {k(s) + k(š), 0} ⇒ indivisibility (extension w/ costly divisibility)
- Price paid by s to š: p^m(s, š), negative if selling (extension w/ financing constraints: p^m(s, š) ≤ ξy(s, n))

Spot market for labor:

• Labor demand for

i) production:
$$n(s; w) = \left(\frac{\gamma z(s)k(s)^{\alpha}}{w}\right)^{\frac{1}{1-\gamma}}$$

ii) entry: n₀ workers per firm

• The owner's value solves the following HJB

$$(r+\delta)V(s) = \underbrace{\max_{n} y(s, n) - wn + \max_{\theta} \partial_{k}V(s)(\theta - \delta_{k}) - C(\theta)}_{\text{production}}$$

$$+ \underbrace{\mu z \partial_{z}V(s) + \frac{1}{2}\sigma^{2}z^{2}\partial_{zz}V(s) + \max_{\lambda}\eta W(s;\lambda)}_{\text{evolution of productivity}}$$

$$\underbrace{W(s;\lambda) = \sum_{\tilde{s}} [V(z, k^{m}(s, \tilde{s})) - V(z, k) - p^{m}(s, \tilde{s})]\lambda(s, \tilde{s})$$

and

where

$$\sum_{\tilde{s}}\lambda(s,\tilde{s}) + \lambda(s,0) = 1$$

Free Entry and Law of Motion

• Occupational Choice ("free-entry")

$$\int V(s)dG(s) - n_0 w \leq \frac{w}{r+\delta}, \quad \phi_e \geq 0, \quad \text{w/ c.s.}$$

- Labor supply in production: $N n_0 \phi_e$
- Distribution over the state space ϕ evolves according to the Kolmogorov Forward (KF) equation

$$\dot{\phi} = \Gamma(\theta, \lambda; \phi) + \phi_e$$

- Evolution of ϕ induced by
 - ▶ investment ▶ trade ▶ entry/exit ▶ individual productivity process

A (stationary) equilibrium is a set of value functions V(s), policy functions for investment $\theta(s)$ and trade $\lambda(s, \tilde{s})$, terms of trade $(k^m(s, \tilde{s}), p^m(s, \tilde{s}))$, wage w, and distribution over the state space $\phi(s)$ that satisfy

- business owners' optimality
- no-arbitrage in occupational choice
- market clearing
- consistency of measures

- \Rightarrow Trade of multiple differentiated goods
 - Standard approach:
 - CES demand/monopolistic competition
 - frictional market with fixed point on matching set
 - Our model:
 - frictionless matching: competitive equilibrium + stochastic trade opportunity
 - block structure, flexible trade module: $(\phi, V) \rightarrow (\lambda, p^m, k^m) \rightarrow (\phi', V')$

- With transferable utility, solution is linear programming problem
 - maximize (static) social surplus s.t. adding up constraints
- Delivers equilibrium allocation (λ , k^m) and prices (p^m)
- Gains from trade W(s) from envelope theorem
- Easy to extend to non-transferable utility environment

details

• Competitive prices are independent of seller's z

$$p^m(s, \tilde{s}) = \mathcal{P}(\kappa(\tilde{s}))$$

Intuition: competitive nature of the equilibrium, same good sold at same price

- Pairwise stability: $\nexists(s, \tilde{s})$ and feasible trade that makes the pair (strictly) better off
- **Competitive allocation** solves the planner's problem starting at $\phi(s, 0) = \phi^{ss}(s)$

- Calibration using data on
 - firm dynamics
 - business transfers
- Model deliverables
 - dispersion in mpk
 - business price and value
- Tax Policy Analysis

Parameter	Value
Discount rate	<i>r</i> = 0.06
Share of rentable input	$\gamma=0.70$
Entry distribution, G	mass point at $z = z_0, k = 1$
Death rate, depreciation rate	$\delta = 0.1, \delta_k = 0.058$
Investment cost, $C(\theta) = A\theta^{\rho}$	$A = 25, \rho = 2$
Trading rate	$\eta=1$
Returns to scale	α = 0.1
Productivity process	μ_z = 0, σ_z = 0.25

- Life-cycle firm dynamics \Rightarrow productivity process, rentable input share, exit rate
- Transaction data \Rightarrow production, investment, meeting technology

- Life-cycle firm dynamics \Rightarrow productivity process, rentable input share, exit rate
- Transaction data \Rightarrow production, investment, meeting technology

Key parameters

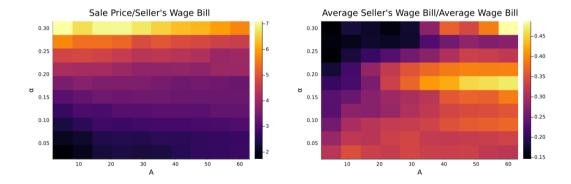

- meeting rate η
- investment cost $C(\theta) = A\theta^{\rho}$
- output elasticity wrt k, $y(z, k, n) = zk^{\alpha}n^{\gamma}$

Key moments from data

- brokered sales: time to sell
- IRS filings
 - trade volume
 - sale price/wage bill
 - selection into selling

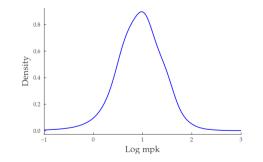

Identification of return to scale (α) and investment cost (A)

- $\alpha \uparrow \Rightarrow k$ share of seller's output $\uparrow \Rightarrow$ price to seller's wage bill, $\frac{p}{qw} \uparrow$
- $A \uparrow \Rightarrow$ quality of marginal seller $\uparrow \Rightarrow$ seller's wage bill, $\frac{nw}{nw} \uparrow$

Dispersion in MPK

- Idiosyncratic change in productivity \rightarrow input reallocation toward higher MPK
- Dispersion in marginal product of capital induced by
 - decentralized trading
 - indivisibility of asset sold
- Standard deviation of log-mpk: 45%

- Finance textbook: Present value of owner's dividend
 - Model counterpart: V(s)

- SCF respondent: Answer to the survey question-"What could you sell it for?"
 - Model counterpart: $\mathcal{P}(k)$

Model Predictions for Business Wealth

- Heterogeneity in transferable share and returns
- Inputs to analysis of capital and wealth taxation

Distribution Pctile	Transferable Share	Income Yield
	$\frac{\mathcal{P}(k)}{V}$	$\frac{y-wn-C(\theta)}{V}$
5	0.00	-0.16
25	0.16	0.07
50	0.25	0.09
75	0.36	0.10
95	0.49	0.11
99	0.64	0.13

- Recent debate on business taxation
- What to tax
 - flows: business income
 - stocks: business capital or wealth
 - transfers: capital gains
- Our model is well-suited to address this question

details

Comparison of

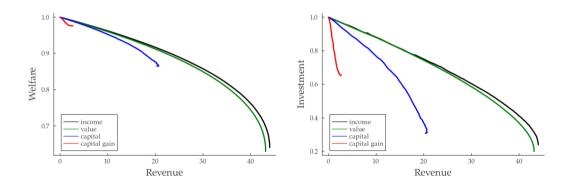

- capital gains: $\tau_c \mathcal{P}(k)$ [capital transaction]
- business income: $\tau_b(y wn)$
- **business capital**: $\tau_k \mathcal{P}(k)$ [capital ownership]
- wealth: $\tau_v V$

Welfare measure: steady-state value at entry conditional on raising revenue *R*

• by indifference at entry, all agents' ex-ante value is proportional to w

• For most levels of *R*, exclusively use τ_b

Intuition

 \Rightarrow 3 margins: entry, investment, reallocation

Compared with tax on income,

- tax on capital gains
 - distorts capital reallocation across firms
 - decreases investment to sell
- tax on business capital plot
 - increases taxes on low z, high $k \Rightarrow$ investment \downarrow
 - lowers taxes on high z, low k (but z is inelastic!)
- tax on wealth \approx tax on income + tax on option value of selling capital

Practical implementation: k and V are not observed

- Estimation using IRS data
 - life-cycle dynamics
 - production and investment technology
- Full study of tax policy
 - undiversifable risk
 - financial constraints
 - alternative instruments

$$X(s,\tilde{s}) = \max_{k^m \in \{k(s)+k(\tilde{s}),0\}} \{V(z(s),k^m) + V(z(\tilde{s}),k(s)+k(\tilde{s})-k^m)\} - (V(s)+V(\tilde{s}))\}$$

$$Q(\phi) = \max_{\pi \ge 0} \sum_{s, \tilde{s}} X(s, \tilde{s}) \pi(s, \tilde{s})$$

s.t. $\sum_{\tilde{s}} \pi(s, \tilde{s}) + \pi(s, 0) = \frac{\phi(s)}{2} \forall s \quad [\mu^{a}(s)]$
 $\sum_{\tilde{s}} \pi(\tilde{s}, s) + \pi(0, s) = \frac{\phi(s)}{2} \forall s \quad [\mu^{b}(s)]$

- From the minimax thm, the solution of the primal problem is equal to the solution of the dual
- The multipliers in the primal are equal to the choice variable in the dual, and vice versa

$$Q(\phi) = \min_{\mu^a \ge 0, \mu^b \ge 0} \sum_{s} \left(\mu^a(s) + \mu^b(s) \right) \frac{\phi(s)}{2}$$

s.t. $\mu^a(s) + \mu^b(\tilde{s}) \ge X(s, \tilde{s}) \quad \forall s, \tilde{s} \quad [\pi(s, \tilde{s})]$

Trade with Preference Shocks

- After-trade values for buyers (v_b) and sellers (v_s)
 - $v_b(s, \hat{k}; p)$: value from buying \hat{k}
 - $v_s(s, 0; p)$: value from selling k(s)
- Matching probability

$$\lambda(s, \hat{k}; p) = \exp\left(\frac{v_b(s, \hat{k}; p) - W(s)}{\sigma}\right)$$
$$\lambda(s, 0; p) = \exp\left(\frac{v_s(s, 0; p) - W(s)}{\sigma}\right)$$

where $W(s) = \mathbb{E} \max\{v_b(s, \hat{k}; p), v_s(s, 0; p)\}$

• Find $\{p(s)\}$ such that $\forall \hat{k}$

$$\underbrace{\int \lambda(s, \hat{k}; p)}_{\text{demand}} = \underbrace{\int \lambda(s, 0; p) \mathbb{I}\{k(s) = \hat{k}\}}_{\text{supply}}$$

• Under capital gain tax τ ,

$$v_b(s; \hat{k}) = V(z, k(s) + \hat{k}) - p(\hat{k})$$
$$v_s(s) = V(\tilde{s}, 0) + (1 - \tau)p(k(s))$$

• Under cap on paid price equal to $\xi y(s, n)$

$$v_b(s;\hat{k}) = \begin{cases} V(z,k(s)+\hat{k}) - p(\hat{k}) & \text{if } p(\hat{k}) \le \xi y(s,n) \\ -\infty & \text{o/w} \end{cases}$$
$$v_s(s) = V(\tilde{s},0) + p(k(s))$$

Terms of trade $\{p^m, k^m\}$ satisfy

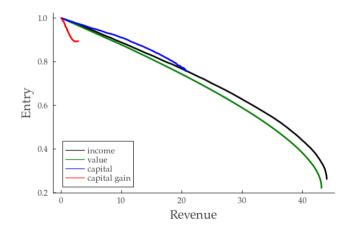

• feasibility

$$k^{m}(s,\tilde{s}) \in \{k(s) + k(\tilde{s}), 0\}$$

$$k^{m}(s,\tilde{s}) + k^{m}(\tilde{s},s) \le k(s) + k(\tilde{s})$$

$$p(s,\tilde{s}) + p(\tilde{s},s) \ge 0$$

• pair-wise stability: $\nexists(s, \tilde{s})$ and feasible trade that makes the pair (strictly) better off

Understanding the Tax Results

log-ratio of taxes paid: $\log\left(\frac{\tau_b(y-wn)}{\tau_k \mathcal{P}(k)}\right)$
